TOR

Filled with sand, 60 centimeters (24 inches) of barrier thickness will stop rifle bullets and shell fragments. It takes 1.5 metres (five feet) of thickness to prevent penetration by a [rocket propelled grenade](#) round. Approximately 1.2 metres (four feet) of thickness provides protection against most [car bombs](#). Therefore wall bastions must be at least 1.2m thick, of a height similar to the perimeter walls and also to provide blast mitigation to buildings close to the perimeter as these HESCO will be located inside of the current wall systems.

Hesco Sizes

The above range of sizes are specific and must have the standard 4mm-5mm wire mesh diameter. Close to variations of sizes must be catered for and we **MUST insist on HESCO quality** as some companies may offer the cheaper Chinese option which has a reduced life span due to inferior materials.
